

Baltimore City has made improving the health and lives of its residents a priority. In order to describe the health and well-being of City residents, BNIA-JFI currently tracks thirteen adult, juvenile, and infant health indicators for Baltimore City and its neighborhoods. The data is provided by the Maryland Department of Health and Mental Hygiene, as well as the United States Bureau of the Census. Where possible, data is presented at the CSA and City level. For several indicators, data is only available at the zip code level. A summary of these health and well-being indicators and their change over the past several years is described below.

### **Safe Homes and Families**

BNIA-JFI tracks two measures of safe homes and families. These are the number of children tested for the presence of lead in their blood and the percent of children who have elevated levels of lead in their blood. Elevated levels of lead in the blood is toxic to many organs and tissues including heart, kidneys, bones, and the nervous system. In children, elevated levels of lead in the blood can lead to permanent learning and behavior disorders.

- From 2000 to 2009, the percentage of children who were tested for the presence of lead in their blood and were found to have elevated blood levels had decreased by 10.4 percentage points from 12.2% in 2000 to 1.8% in 2009.
- The percentage of children who were tested for the presence of lead in their blood and were found to have elevated blood lead levels decreased by 1.3 percentage points from 3.1% in 2008 to 1.8% in 2009.
- In 2009, 1.8% of the children who were tested for the presence of lead in their blood were found to have elevated blood lead levels. The CSAs with the highest levels of blood lead were Madison/East End, Clifton-Berea, and Greenmount East.

## Income and Poverty

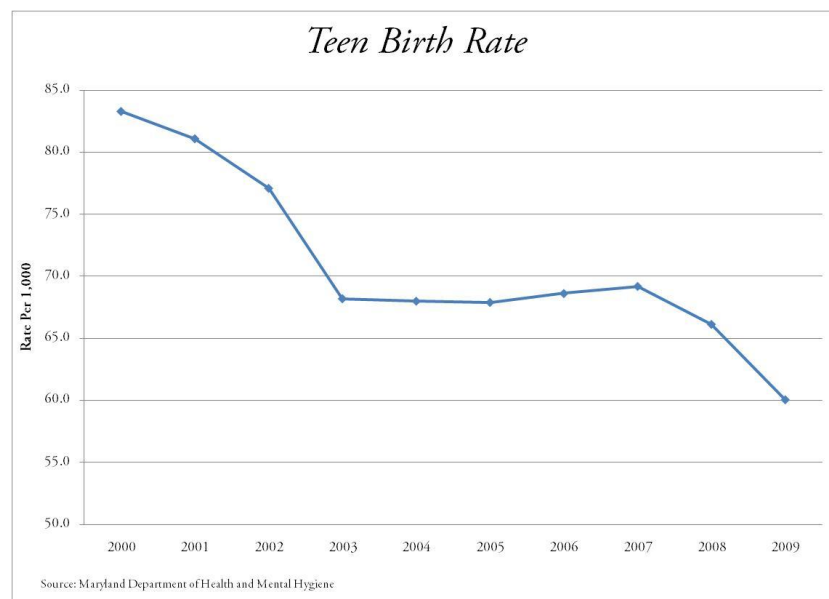

The median household income is used as a measure of household wealth. Typically, the greater the income, the more a household can afford to purchase goods, services, and housing. This data comes from the United States Bureau of the Census and is available only at the City level.

- From 2000 to 2009, the median household income of Baltimore City residents increased by 28.9% from \$30,078 to \$38,772.
- From 2008 to 2009, the median household income of Baltimore City residents decreased by 3.8% from \$40,313 to \$38,772.

## Maternal and Child Health

Good health begins with babies being born healthy. BNIA-JFI tracks four measures of maternal and child health. These include the percent of births where the mother received early prenatal care; the percent of births delivered at term; the percent of babies born with a satisfactory birth weight; and teen birth rate.

- The percentage of births where mothers received early prenatal care in their first trimester increased from 73.7% in 2008 to 77.4% in 2009.
- In 2009, Greenmount East had the lowest percentage of mothers receiving early prenatal care at 66.5%. Cross-Country/Cheswolde had the highest rate with 93.1% of mothers receiving early prenatal care.
- From 2008 to 2009, the percentage of births delivered at term (37 to 42 weeks) in Baltimore City increased slightly from 86.3% to 86.7%.
- From 2008 to 2009, the percentage of babies born with satisfactory birth weight remained steady at 87.2%.
- The teen birth rate in Baltimore City decreased from 66.1 per 1,000 teens giving birth in 2008 to 60.1 in 2009. In four CSAs, at least one in ten teens gave birth in 2009. These CSAs include: Downtown/Seton Hill, Madison/East End, Greater Rosemont, and Cherry Hill.

- The teen birth rate in Baltimore City has declined from 83.3 in 2000 to 60.1 per 1,000 teens giving birth in 2009.

## Access to Health Insurance and Preventative Health Care

Access to health insurance and preventative health care is an important issue in Baltimore City. Without access to health care or preventative care, residents in Baltimore City are more susceptible to illness and preventable illnesses can become life-threatening. In 2009, BNIA-JFI tracked two indicators: the number of children hospitalized for asthma; and the percent of persons with vaccine-preventable diseases (per 10,000 persons). In previous years, BNIA-JFI tracked the percent of emergency room visits that are not emergency-related. While not reported by BNIA-JFI for 2009, BNIA-JFI is working to collect and analyze this data and will provide it at a later date.

- From 2008 to 2009, the number of children hospitalized for asthma increased from 961 to 1,071.
- In Baltimore City, the number of children hospitalized for asthma has increased slightly from 1,034 in 2000 to 1,071 in 2009.
- From 2008 to 2009, the percentage of persons with vaccine-preventable diseases decreased from 7.2% to 1.6%.
- In Baltimore City, the percentage of persons with vaccine-preventable diseases has decreased from 13.4% in 2000 to 1.6% in 2009.

## Drug Treatment

The number of persons receiving treatment for addiction to illegal substances is used as a measure of the drug addiction problem in the City. This indicator does not fully capture the extent of the problem in Baltimore City for two reasons. First, the indicator only captures persons with either the financial resources or willingness to seek treatment. Second, the number of persons receiving treatment is limited to the total number of available spaces for persons to be treated. Both of these reasons translate into a conservative figure for the drug addiction problem in Baltimore City.

- In 2009, over 18,500 persons were receiving treatment for addiction to drugs.
- From 2008 to 2009, the percentage of persons receiving treatment for drugs declined by 20.6%.
